# Jetons un oeil

Genevieve shows her friend Anne a magic trick. With her back to Anne, she gives her the following instructions :

" Lay out 13 tokens numbered 0 to 12 in a straight line, setting them in decreasing order from left to right.

Then turn them face down to hide the numbers written on them.

To the right of those already laid out but along the same line, add twelve more tokens picked at random with their faces down.

End by moving to the left end of the line some of the tokens that have just been added. "

Genevieve then turns round, facing a line of 25 identical tokens. She picks one and it tells her how many tokens have been moved by Anne.

Explain what the trick is.
